Qubik AI & Automation: Launch Plan

Buyer: Australian wholesale distributors that import their own stock, A$3–10M revenue

Problem: Supplier and freight invoices processed by hand, so costs reach prices late and office hours go on chasing paperwork. Container costing is the hook.

Prepared by: Vinaygopal Mawandia · 19 October 2026

Facts carry their source in brackets and are listed at the end. Estimates are called estimates where they appear. Everything else is my recommendation.

Where I started, and why distributors

Most of the noise about AI for small business is at the front desk: chatbots, missed-call tools, booking assistants. In my experience the valuable work sits further back, in the paperwork that moves money through a business. At Cometlab.ai, which sells similar AI and automation services in India, the clients who came looking for help were mostly manufacturers and distributors. They had digital systems, but still relied on people to keep those systems fed and running, which is exactly where automation pays off. Their businesses run on documents, and the documents tend to grow faster than the team does.

So I started there, and checked whether the instinct held up in Australia and on Meta.

- **There are enough of them.** About 10,800 Australian wholesalers turn over A$2–10M (ABS), and I estimate around 6,700 sit in Qubik's A$3–10M range. That's 16% of all wholesalers, against 7% for trades (ABS), which matters on a platform that can't target by company size.
- **Meta can reach them.** Meta's own estimates put about 550,000–650,000 Australians aged 30–65 who are business owners or page admins and interested in trade, wholesale, freight or supply chain (Meta API, Oct 2026). About half are 45–65.
- **Qubik has a real edge.** Landed cost, stock values and import GST all end up in the Xero file an accountant reads every month, and Qubik is a Xero Platinum partner (Xero).
- **The pressure is current.** The ACCC found record stevedoring charges flowing through to importers (ACCC, Dec 2025).

Trades, pubs, labour hire and job-shop manufacturers each fell short on firm size, crowding, margins or build risk.

1. Buyer and problem

The organisation. They buy from overseas factories, hold stock in an Australian warehouse and sell to trade or retail customers: hardware, electrical, lighting, auto parts, packaging, homewares, food. Typically A$3–10M revenue and 10–40 staff. They'd describe themselves as "the Australian distributor for…", so the ads speak to what they do rather than a label.

The decision-maker. The owner or MD signs off. The finance or office manager, or an external bookkeeper, has a strong say because they live with the problem.

The problem. Supplier and freight invoice processing. Every purchase creates invoices from suppliers, forwarders and customs brokers that someone has to chase, check, match and key in. Containers are where it hurts most visibly, so that's the hook: a container's costs don't arrive with it. The supplier invoice comes first, the freight bill later, and the broker's invoice, with duty and GST, can land weeks after the stock is on the shelf. Systems like Unleashed can spread these costs and recalculate margin after sale (Unleashed), so software isn't the gap; the manual paperwork feeding it is. Meanwhile stock sells at last quarter's price, and it repeats with every container.

What it likely costs (my estimate, replaced by real numbers in the diagnostic). A A$6M distributor with A$3.6M of imported sales. If freight or the dollar lifts landed costs 5% and prices catch up three months later, that's about A$45k of margin gone; two such moves a year is around A$90k. Add the office time: half a role spent chasing and keying invoices is roughly A$35–40k a year.

Buying triggers. A freight or currency jump, a quarter where margin seems to have "gone missing", the bookkeeper leaving, or a stocktake that won't reconcile. Timing helps: Christmas stock is landing now, and pre-Chinese New Year orders (6 February 2027) go to factories in November (Sino-Shipping), so the paperwork peaks at launch.

Ability to pay. At this size, with stock on the floor, A$57–90k is a normal investment if it pays back within about a year, which is exactly what the diagnostic tests. Cash position gets checked on the first call.

Why Meta, and its limit. The owners are there, but Meta can't pick them out: relevant job titles return its minimum of about 1,000 Australians, software interests like Xero don't exist, and Leads campaigns force Advantage+ audience (Meta API). Real buyers are perhaps 15–20k of the ~600k audience, about 3% (my estimate). So the hook and the form do the filtering.

2. Offer and proof

The Container Cost Check: A$3,500 + GST, founding-client price. Three weeks, fixed scope. The client gets:

1. **Their last three to five shipments, costed properly** from the real documents.
2. **The gap in dollars:** true cost against system cost and the price they sold at, product by product, showing where margin slipped and for how long.
3. **The invoice workload:** how many supplier, freight and broker invoices a month, how long each takes, and the lag from arrival to fully costed.
4. **A fixed-price plan** to have costs worked out the day the paperwork lands, with the payback spelled out.
5. **A one-hour sit-down with the owner**, plus a short written report.

They provide read-only Xero access, a few recent shipments' documents and about two hours of staff time.

On price. A "was A$7,500" claim has to reflect a price actually charged (ACCC), so I'd say "A$3,500 for our first ten clients, A$7,500 after that", once Qubik commits.

Proof at launch, all of it real. Qubik's standing as a Xero Platinum partner since 2013, with CA ANZ and CPA memberships (Xero). The automation specialist, named, showing something they've built. A sample report on labelled dummy data. And the founding-client deal: the first ten get the lower price in return for anonymised before-and-after results, so proof is built rather than invented.

From diagnostic to implementation. The check puts a dollar figure on the client's own leak, and that becomes the business case for a build already scoped and priced in the report. The A$3,500 is credited if they go ahead within 30 days. A typical build automates supplier and freight invoice processing end to end: invoices are picked up from the inbox, read, matched to the purchase order or shipment and posted into Xero, Unleashed or Cin7; landed cost updates as each container's documents arrive; and a weekly list

flags products below target margin. Staff approve anything uncertain. Container costing is the visible win; the invoice processing behind it sizes the build within A$57–90k, depending on systems and volume.

3. Meta acquisition

Objective. Leads, on a "higher intent" Instant Form, which adds a review step. Facebook and Instagram feeds and Reels, with Audience Network off because that's where junk leads come from. A$900 over 14 days.

Audience. One ad set, because splitting A$900 starves every cell of data. Australia, 30–65, with trade interests (international trade, wholesale, supply chain, freight, procurement, Alibaba.com) and the "small business owners" and "page admins" behaviours as signals: roughly 550–650k people (Meta API), excluding Qubik's clients. Test two: 1-mile pins over port-side warehouse estates (Eagle Farm, Wetherill Park, Dandenong South, Kewdale), about 11–12k people with the owner signals. Month three: gift and homewares trade fairs, where nearly every exhibitor imports.

Creative. A real Qubik accountant, filmed on a phone beside a desk of shipping paperwork, talking plainly. Advice, not an ad.

First test. Three hooks in the same ad set, with Meta deciding where spend goes. All three point at the same problem but test a different cost of it: (A) margin: "Freight went up again. Did your prices?" (B) capacity: "Before you hire another person to chase supplier invoices…" (C) risk: "If your office manager left tomorrow, could anyone cost a container?" Judged on cost per qualified lead; if margin doesn't land, spend moves to the winner without changing the offer.

Sample ad (hook A):

> **Freight went up again. Did your prices?**
> When a container lands, the costs don't arrive with it. The supplier invoice comes first, the freight bill later, and the broker's invoice weeks after that. Until someone pulls it together, nobody knows what the stock really cost, and it's selling at last quarter's price.
> We're Qubik, Xero Platinum accountants in Brisbane. We'll rebuild the true cost of your last few containers, show you where margin slipped, and what it would take to have it worked out the day the paperwork lands.
> Three weeks, fixed fee. A$3,500 + GST for our first ten clients.
> For Australian distributors who import their own stock.

Lead form. Name, mobile, work email, company and consent, plus a privacy policy link, which Meta requires. Then five questions:

What it tells us	Question	Answers
Need and fit	Do you import your own stock?	Yes, by the container · Yes, smaller shipments · No
Need	What runs your stock and invoicing?	Xero only · MYOB · Unleashed or Cin7 · Something else
Size	Annual revenue	Under A$2M · A$2–5M · A$5–10M · Over A$10M
Authority	Your role	Owner/MD · GM or operations · Finance or office manager · Other
Urgency and budget	If a fix paid for itself within a year, could you fund it in the next six months?	Yes, soon · Probably · Not now / just looking

4. Qualification, nurture and handover

Scoring. At four to six leads a person calls every one; tiers set priority, not whether someone is contacted. Hard gates: they import, revenue is A$2M+, role isn't "Other". **Qualified:** passes and answers "Yes, soon" or "Probably". **Review:** passes but says "Not now", or is over A$10M; a person decides. **Nurture:** fails a gate; monthly email only. At volume this becomes a points score fed back to Meta.

Six events from form to sales:

#	Event	What happens	Owner
1	Lead arrives	In the CRM within a minute: contact details cleaned, duplicates merged, tier set, consent and source ad recorded.	Automation
2	Reply within 5 minutes	SMS and email from a named Qubik accountant with a booking link. Review-tier leads get a same-day call instead.	Marketing; Automation triggers it
3	Call within 15 minutes (business hours)	Check any uncertain answers and book them on the spot.	Sales
4	Booked	Booking stops every chaser; two pre-call questions (what they sell, last container date). Not booked: email day 1, SMS day 3, email day 6, then monthly.	Automation; chasers by Marketing
5	Reminders and no-shows	Email the day before, SMS two hours before, both with a reschedule link. No-show: SMS after ten minutes, email next day, a call on day 3, then monthly.	Marketing; call by Sales
6	Handover	One-page brief (answers, ad seen, all messages). Sales accepts or rejects within a business day, with a reason I review weekly.	Sales, with Marketing

The rules that stop it going wrong.

- **Duplicates:** matched on mobile, email or company, merged, never restarted. Qubik clients go to their own accountant.
- **Replies:** pause the automation; a person answers within two business hours.
- **Opt-outs:** STOP or unsubscribe removes them everywhere immediately (the law allows five working days; ACMA). Every message identifies Qubik.

- **Uncertain answers:** never auto-rejected. **Escalation:** complaints, privacy, price negotiation or automation failures go straight to a named person.

Who owns what. Marketing (me) owns ads, form, tiers and routing rules, copy, SMS and email sending, nurture and reporting. Automation (Qubik's specialist and IT) owns CRM connections, message triggers and consent records. Sales (Qubik) owns calls, accepting or rejecting leads, and closing the diagnostic and the build.

First email:

> **Subject:** Your container costs, {FirstName}
> Hi {FirstName}, thanks for getting in touch. From your answers, {Company} is exactly who we built the Container Cost Check for. Next step is a 20-minute call with me about how your shipments get costed today, and whether the check is worth it for you. Grab a time: {link}, or just reply and I'll work around you.
> {Rep}, Qubik Accounting · {unsubscribe}

First SMS:

> Hi {FirstName}, it's {Rep} from Qubik about your container costs enquiry. Book a quick call here: {link} Reply STOP to opt out

5. Economics and downside

These use the brief's rates, all applied to qualified leads, with A$73.5k as the midpoint implementation value:

	A$150 CPL	**A$225 CPL**
Leads (A$900 ÷ CPL)	6	4
Qualified (30%)	1.8	1.2
Attended (70% of qualified)	1.26	0.84
Diagnostics (50% of qualified)	0.9 = A$3,150	0.6 = A$2,100
Implementations (25% of qualified)	0.45 = A$33,075	0.3 = A$22,050
Gross attributed revenue	**A$36,225**	**A$24,150**

Across the A$57–90k range: A$28,800–43,650 and A$19,200–29,100. Crediting the diagnostic fee trims about A$1,600 and A$1,050.

Reading it honestly. A$900 buys four to six leads, so the real result is nothing or one sale: a funnel test, not a forecast. The rates are generous (7 in 10 attendees buy a diagnostic, half of those build), and almost all revenue is implementation, arriving two to four months later.

The plan I'd hold us to:

By	**Expect**	**If not**
A$450 spent	At least 2 leads, at least 1 qualified	Change the hook
A$900 spent	CPL at or under A$225, at least 30% qualified, at least 1 call booked	Work through the list below
Day 30	At least 1 diagnostic sold	Strengthen proof and offer

The main risk is lead quality, not lead cost. Each lead is worth about A$6,000 at the brief's rates, so even a A$600 CPL works if 30% qualify. But only about 3% of the people Meta reaches are real buyers; if the form fills with the rest, qualification drops to 10–15% and everything downstream shrinks.

What I'd change first: the filter. If qualification is low, I'd sharpen the callout ("for distributors who import by the container") and move revenue to the first question. Only after that, in order: the hook and video if CPL is high, response speed and the call offer if the right people aren't booking, and proof and founding terms if they book but don't buy.

6. Priorities, assumptions and AI

First 14 days:

1. **Check the ground before spending (days 1–5).** Meta audience sizing is already done (Section 1). Next: a Meta Ad Library scan for anyone already targeting distributors, five short conversations with distributors Qubik knows, and the automation specialist's sign-off that the check can be delivered in three weeks at a profit.
2. **Get launch-ready, then try to break the funnel (days 3–8).** Privacy policy, a live-looking Qubik page, an accountant willing to be filmed, founding terms signed off, section 4 tested with dummy leads, and sales committed to the 15-minute call.
3. **Run the A$900 test (days 8–14 and on).** Daily checks, a proper read at A$450, and sales feedback on every lead.

Assumptions to validate: that invoice processing really hurts at this size; document access; willingness to pay A$3,500, then A$57–90k; sales capacity; my estimates; pricing, consent and privacy compliance.

What I did, what AI did, and how I checked.

- **My calls:** the segment came from my Cometlab experience, where similar businesses in India kept describing the same pain; I then tested it against Australian data. My Meta experience targeting older business owners gave me another reason to back this niche. The AI's first suggestion was trades; I dropped it because only 7% of trade businesses fall in the target revenue band.
- **Claude (Anthropic), via Claude Code:** analysed ABS business counts, pulled Meta audience sizes via read-only API calls, found sources, and drafted text I rewrote.
- **My checks:** spot-checked ABS figures, verified the Meta numbers in Ads Manager, recalculated the economics by hand, and checked every source.

Sources

- **ABS:** *Counts of Australian Businesses* (8165.0), data cube 3, industry class by turnover, June 2025.
