DevZero · SEO Priorities

devzero.io: Kubernetes and GPU compute optimisation for platform and infrastructure teams

~820	1,013	526	2–5k
organic visits/mo (Cast AI: 1.7k)	ranking keywords, 455 in top 10	referring domains (Cast AI: 3,665)	visits/mo in 12 months, all markets

Where the site stands

What is working

- **Already competitive:** more search traffic than ScaleOps, PerfectScale and Sedai; about half of Cast AI.
- **Pricing pages are the engine:** 5,200+ instance pages bring 77% of traffic and 746 ranking keywords.
- **Top 10 for cloud pricing guides:** GKE pricing #3, EKS pricing #7, AKS pricing #8.
- **Solid technical base:** fast server-rendered pages, clean canonicals, rich structured data, AI crawlers allowed.

What is holding it back

- **Money pages get no search traffic:** /kubernetes-cost-optimization ranks #59 for its own term.
- **The pivot left traces:** 27 old URLs with links from 153 sites redirect to /blog or return errors.
- **Out-of-date signals:** llms.txt and off-topic webinars still describe dev environments.
- **Missing from "best Kubernetes cost tools" lists** (not in the top 80) and review sites.

SEO interventions needed

Priority	Intervention	Why it matters
Now	Clean up after the pivot: redirect the 27 linked old URLs to relevant pages, refresh llms.txt, remove off-topic pages, fix "2025" titles.	Recovers links from 153 sites (about 30% of the total) and tells Google and AI assistants what DevZero does today.
Now	Take back the ~39 Kubernetes posts duplicated on nautili.ai.	Stops the two sites competing with each other for the same searches.
1–3 mo	Improve region and instance pages (us-east-1 alone: ~33k searches/mo at #16–18) and launch a GPU price index.	Where the volume is: 47 keywords with 200+ searches each sit just off page one.
1–3 mo	Add "alternatives" pages, get onto "best tools 2026" lists and G2, Gartner and Capterra.	Small volume (~100/mo) but the highest intent; these lists feed the answers AI assistants give.
1–3 mo	Publish a "State of Kubernetes Waste" report from cluster-analyser data.	Original data earns the links needed to close the gap with Cast AI (3,665 linking sites).
3+ mo	Publish twice a week, led by KEDA, Karpenter and EKS Auto Mode guides, then rightsizing and GPU topics.	Autoscaling education has ~10.5k searches/mo at low difficulty (23) and feeds the money pages.

Traffic opportunity

Topic area	US searches/mo (difficulty)	Role
Kubernetes cost optimisation and rightsizing	~460 (8)	Bottom of funnel: demos
Autoscaling education (KEDA, Karpenter, HPA)	~10.5k (23)	Awareness, internal links
Cloud, instance and GPU pricing	~41k head + ~90k long tail (25)	Volume, links, tool usage
Competitor "vs" and "alternatives"	~100 (8), plus 8k brand	Highest conversion

Source: DataForSEO (Google Ads volumes, Labs rankings and backlinks), US, 12 Nov 2026. Volumes are addressable searches (close variants merged, competitor brand names excluded); difficulty is 0–100. Visits are DataForSEO estimates; Search Console is not yet connected. Buying-intent searches are small, but a single DevZero customer is worth five to six figures a year.

Plan and what we need from you

When	Focus
Weeks 1–4	Technical clean-up and redirects, separate content from Nautili, connect Search Console for a real baseline
Months 2–3	Region and instance pages, GPU price index, alternatives pages, list and review-site outreach
Months 4–12	Publish twice a week, data report, improve programmatic pages, track AI assistant mentions

What we need from you: Search Console access for our reporting account, analytics access, CMS access (or a developer contact for redirects), anonymised cluster-analyser data for the report, and sign-off on which pages move to Nautili.
