DevZero · SEO Priorities

devzero.io: Kubernetes and GPU compute optimisation for platform and infrastructure teams

~5,500	67	11	20–50k
indexable pages	blog posts (leaders: 250–550)	competitor comparison pages	est. monthly visits in 12 months

Where the site stands

What is working

- **Solid technical base:** fast server-rendered pages, clean canonicals, rich structured data, AI crawlers allowed.
- **Unique pricing tools:** 5,200+ instance, spot and GPU pricing pages that no direct competitor matches.
- **Clear money pages:** cost optimisation, pod rightsizing, VPA, Karpenter, GPU, plus 11 "vs" pages.
- **Ranks well for:** "VPA alternative", "rightsizing without restarts" and "EKS cost optimization".

What is holding it back

- **The pivot left traces:** old dev-environment URLs redirect to /blog, which wastes their backlink value.
- **AI summary file (llms.txt) is out of date:** it still describes MicroVMs and dev environments.
- **Off-topic pages indexed:** Python and JavaScript webinars dilute the site's focus on Kubernetes.
- **Missing from "best Kubernetes cost tools" lists** and review sites, where buyers and AI assistants look.

SEO interventions needed

Priority	Intervention	Why it matters
Now	Clean up after the pivot: redirect old posts to relevant pages, refresh llms.txt, remove off-topic pages, fix "2025" titles and heading errors.	Recovers lost authority and tells Google and AI assistants clearly what DevZero does today.
Now	Take back the ~39 Kubernetes posts duplicated on nautili.ai.	Stops the two sites competing with each other for the same searches.
1–3 mo	Add "alternatives" pages (Cast AI, Kubecost, ScaleOps, PerfectScale, Zesty, Spot Ocean) and an AKS/OKE solution page.	The highest-converting searches in the category; competitor acquisitions are creating demand.
1–3 mo	Get listed: outreach to "best tools 2026" list authors, plus G2, Gartner and Capterra profiles.	These lists dominate page one and feed the answers AI assistants give.
1–3 mo	Launch a GPU price index and a "State of Kubernetes Waste" report from cluster-analyser data.	Original data earns links and press; GPU pricing is a fast-growing search.
3+ mo	Publish twice a week across rightsizing, GPU, autoscaling, cloud and pricing topics; make instance pages more unique.	Closes the content gap with Cast AI and PerfectScale and keeps programmatic pages indexed.

Traffic opportunity

Topic area	Est. monthly searches	Role
Kubernetes cost optimisation and rightsizing	5–10k	Bottom of funnel: demos
Autoscaling education (HPA, VPA, Karpenter)	30–60k	Awareness, internal links
Cloud, instance and GPU pricing	100k+ (long tail)	Volume, links, tool usage
Competitor "vs" and "alternatives"	1–3k	Highest conversion

Search volumes are directional estimates, to be confirmed with Ahrefs/Semrush and Search Console data in week 1. A single DevZero customer is worth five to six figures a year, so a small number of extra demos justifies the investment.

Plan and what we need from you

When	Focus
Weeks 1–4	Technical clean-up, separate content from Nautili, baseline rankings and traffic
Months 2–3	Alternatives pages, list and review-site outreach, GPU price index
Months 4–12	Publish twice a week, data report, improve programmatic pages, track AI assistant mentions

What we need from you: Search Console and analytics access, CMS access (or a developer contact for redirects), an Ahrefs/Semrush seat, anonymised cluster-analyser data for the report, and sign-off on which pages move to Nautili.
