nautili.ai: the LLM gateway for routing, spend attribution and governance of AI traffic

~717	~7	2	10–30k
indexable pages	posts on LLM topics (of 46)	competitor comparison pages	est. monthly visits in 12 months

Where the site stands

What is working

- **Solid technical base:** fast pages, clean canonicals, Dataset and FAQ structured data, an accurate llms.txt.
- **573 model and provider pages** that give a base for model-pricing searches.
- **Strong early content:** OpenRouter and Portkey comparisons, open-source gateways roundup, Claude Code cost.
- **Clear pricing advantage:** a 4% fee versus about 5.5% on OpenRouter, with your own keys or GPUs.

What is holding it back

- **Brand not yet visible:** a search for "nautili.ai" returns unrelated "Nautilus" companies.
- **~39 DevZero Kubernetes posts duplicated** on the blog, off-topic for an LLM gateway.
- **devzero.io sells the same product** on its own /inference pages without mentioning Nautili.
- **Thin coverage:** 2 comparison pages and 1 integration page; missing from "best LLM gateway" lists.

SEO interventions needed

Priority	Intervention	Why it matters
Now	Remove the duplicated Kubernetes posts (redirect each to its devzero.io original).	Gives Nautili a clear AI-gateway focus and ends competition between the two sites.
Now	Redirect devzero.io/inference pages to nautili.ai and add a "Nautili by DevZero" link on devzero.io.	Transfers DevZero's authority to the new domain, the fastest way to make the brand visible.
Now	Set up Search Console, brand schema (sameAs links), consistent "Nautili" naming, heading fixes.	Helps Google recognise Nautili as a distinct brand rather than a typo for "Nautilus".
1–3 mo	Add 8+ comparison and "alternatives" pages (OpenRouter, Portkey, LiteLLM, Helicone, Bifrost, Cloudflare, Vercel, Kong).	Portkey (Palo Alto Networks) and OpenRouter (Stripe) acquisitions are pushing buyers to look elsewhere.
1–3 mo	Add integration pages (Cursor, Codex, Gemini CLI, LangChain, Vercel AI SDK) and a stand-alone fee calculator.	Captures searches from developers already using those tools, plus a shareable, link-earning tool.
3+ mo	Own "AI coding spend": cost-per-developer content and a data report from gateway traffic; add live price and latency data to model pages.	A fast-growing, lightly contested topic that engineering leaders with budgets are searching for.

Traffic opportunity

Topic area	Est. monthly searches	Role
LLM gateway, AI gateway, LLM router	10–20k	Category intent
OpenRouter, Portkey and LiteLLM alternatives	5–10k (rising)	Highest conversion
AI coding cost (Claude Code, Cursor, Codex)	20–60k	Engineering leaders with budgets
Model API pricing (Claude, GPT, Gemini)	100k+ (long tail)	Volume; highly competitive

Search volumes are directional estimates, to be confirmed with Ahrefs/Semrush and Search Console data in week 1. Nautili is self-serve, so search volume turns directly into sign-ups on the free Demo tier.

Plan and what we need from you

When	Focus
Weeks 1–4	Remove duplicates, redirects from devzero.io, Search Console and brand set-up, alternatives pages
Months 2–3	Comparison and integration pages, fee calculator, Product Hunt and Hacker News launch, list outreach
Months 4–12	AI coding spend cluster and report, richer model pages, case studies, track AI assistant mentions

What we need from you: Search Console and analytics access, CMS access, an Ahrefs/Semrush seat, sign-off on moving inference pages from devzero.io, 3–5 customer stories, and anonymised gateway data for the spend report.
